

CALIQUA SA

ENVIRONMENTAL POLICY

In our eyes, environmental management means acting in a legally compliant, eco-friendly and responsible way in terms of how we run our business and in the planning, implementation, commissioning, assembly and servicing of thermal plants.

We help to reduce the consumption of the planet's resources and damage to the environment, and we do so with vigour and determination. We are continually working to make our services more environmentally friendly in order to preserve the natural world for future generations. In doing so, we hold ourselves to the following six principles when pursuing our goals:

- Environmental protection measures that incorporate ongoing improvements to our environmental contributions are a given for us and form a key link in the value chain.
- We make our colleagues aware of issues surrounding environmental management and we improve their skills in this area by systematically and regularly sharing knowledge about environmental matters.
- Our colleagues demonstrate a great sense of responsibility in matters relating to the environment. As experts, they can improve processes and employ products that are as environmentally friendly as possible.
- With regard to our products and services, we strive to minimise our consumption of resources and to use materials that are environmentally friendly.
- We work very closely with our clients, our partners and our suppliers to put into practice the principle of protecting the environment «at source». This means reducing our energy consumption and the pollution we create during construction, when operating installations, and when choosing service providers.
- We are conscious of the fact that market regulations alone are not enough to achieve ambitious environmental objectives. For this reason, we not only comply with statutory regulations, but we also tackle environmental issues in a proactive and constructive way, by focusing on solutions and collaborating with authorities, professional organisations and universities.
